# Clinical And Radiological Anatomy Of The Lumbar Spine, 5e

## Synopsis

Clinical and Radiological Anatomy of the Lumbar Spine 5e continues to offer practical, comprehensive coverage of the subject area in a unique single volume which successfully bridges the gap between the basic science of the lumbar region and findings commonly seen in the clinic. Now with a greatly increased imaging section, this book will be ideal for students and practitioners of chiropractic, osteopathic medicine and osteopathy, physiotherapy, physical therapy, pain medicine and psychiatry worldwide. Presents a clear and accessible overview of the basic science relating to the structure and function of the lumbar spine. Written by an internationally renowned expert in the fields of both clinical anatomy and back pain. Describes the structure of the individual components of the lumbar spine, as well as the intact spine. Goes beyond the scope of most anatomy books by endeavouring to explain why the vertebrae and their components are constructed the way they are. Provides an introduction to biomechanics and spinal movement with special emphasis on the role of the lumbar musculature. Explores both embryology and the process of aging in the context of spinal structure and function. Explores mechanical back pain within the context of the structural and biomechanical principles developed earlier in the volume. Extensive reference list allows readers seeking to undertake research projects on some aspect of the lumbar spine with a suitable starting point in their search through the literature. Perfect for use both as an initial resource in undergraduate training in physiotherapy and physical medicine or as essential reading for postgraduate studies. Greatly expanded section on medical imaging. Increased elaboration of the regional anatomy of the lumbar spine. Includes chapter on reconstructive anatomy, which provides an algorithm showing how to put the lumbar spine back together. Presents an ethos of 'anatomy by expectation'™ - to show readers what to expect on an image, rather than being required to identify what is seen.

I commenced research into spinal pain, in 1972, when essentially nothing was known about the problem. There being no established groups or departments working on this problem, I forged my own career, using borrowed resources. I commenced in a Department of Anatomy, where I pursued the innervation of the vertebral column as a fundamental element in understanding the sources and mechanisms of spinal pain. Professor Jim Lance fostered this interest, and accommodated my PhD studies. In his department I continued my anatomy studies but was able also to commence clinical applications. I developed and tested new diagnostic and surgical procedures for back pain and for neck pain. While in Professor Lance's Department, I participated in laboratory studies of the mechanisms of migraine. At the University of Queensland I continued to develop and apply the diagnostic and surgical techniques that I started at the University of NSW, serving as an honorary medical officer at the Pain Clinic of Princess Alexandra Hospital. Meanwhile I supervised science and medicine postgraduate students who undertook basic science studies into the biomechanics of the back and neck. At the University of Newcastle, I had established a reputation sufficient to attract a grant from the Motor Accidents Authority of NSW to investigate the cause and treatment of neck pain after whiplash. The grant supported three PhD students over a six year period. They performed studies that validated the diagnostic procedures and which tested the surgical procedures in a placebo-controlled double-blind randomized trial. Having established an international standing in the development and testing of treatments for spinal pain, I participated in the design and analysis of controlled trials conducted elsewhere in Australia and in the USA. These tested the efficacy of: lumbar radiofrequency neurotomy for back pain, intradiscal electrothermal anuloplasty for back pain, prolotherapy for back pain, exercises for neck pain. Between 1997 and 2002 I conducted the National Musculoskeletal Medicine Initiative which developed and tested evidence-based practice guidelines for the management of back pain, neck pain, shoulder pain, knee pain, and pain in the foot, wrist, and elbow. My work has been awarded the Volvo Award for Back Pain Research, the Research Prize of the Cervical Spine Research Society, the Award for Outstanding Research of the North American Spine Society, and three times the Research Prize of the Spine Society of Australia. My students have been awarded research prizes by the International Association for the Study of

Pain, the Australian Rheumatology Association, and the Australian New Zealand College of Anaesthetists. I have never had a funded department to which to attract investigators and academics. I have relied on scholarships for students, and the goodwill of private practitioners who wished to contribute to clinical research. Of late, I have been supervising Neurosurgery residents undertaking studies of the outcomes of treatment for Radicular pain and back pain.

This is probably the third or fourth edition that I have bought, and there is no doubt: Bogduk is the King of spinal anatomy. I absolutely love this book, and only wish that he would publish a book on the cervical and thoracic spine! It's a must-have for any spine care professional.

The best book on the subject so far!! I already have a hard copy , when I saw the kindle version I jumped at it. I wish many medical books are made available for the iPad

Mr. Bogduk has a great command of the literature, and is a clinician. This is the way anatomy should be taught! Every data that is presented is supported by the literature in some way, and is linked to pathology and clinical presentations. Just wonderful!

Excellent book!!

Excellent book!

Well written book

I own and have studied an older version of this anatomical textbook and there is nothing that I've found since that matches Dr. Bogduk's command of the anatomy and function of the lumbar spine. An anatomist and a clinician in the practice of Interventional Pain Management, Dr. Bogduk is a class by himself. Some of his research has enabled the development of procedures clinically useful in chronic lumbar pain. Clinicians familiar with "facet rhizotomy" procedures may not know that it was Bogduk's anatomical expertise that led him to conclude that the original positioning of the radiofrequency probe by C. Norman Shiley, MD, was incorrect. Later, Bogduk's tireless dissections allowed this procedure to be performed more correctly, anatomically, and led to its popularization and improvement. For doctors, residents and medical students in love, as I am, with the anatomy of the human spine, there is no better guide than Nikolai Bogduk MD, PhD.

This is an amazing book by an amazing author and doctor. The whole book is a marvel of logic and clinical precision. The chapter on Reconstructive Anatomy is just captivating. In one word and several hyphens just A-W-E-S-O-M-E.
