The second edition of *Microorganisms in Foods 7: Microbiological Testing in Food Safety Management* updates and expands on information on the role of microbiological testing in modern food safety management systems. After helping the reader understand the often confusing statistical concepts underlying microbiological sampling, the second edition explores how risk assessment and risk management can be used to establish goals such as a tolerable levels of risk, • Appropriate Levels of Protection, Food Safety Objectives or Performance Objectives for use in controlling foodborne illness. Guidelines for establishing effective management systems for control of specific hazards in foods are also addressed, including new examples for pathogens and indicator organisms in powdered infant formula, *Listeria monocytogenes* in deli-meats, enterohemorrhagic *Escherichia coli* in leafy green vegetables, viruses in oysters and *Campylobacter* in poultry. In addition, a new chapter on application of sampling concept to

microbiological methods, expanded chapters covering statistical process control, investigational sampling, environmental sampling, and alternative sampling schemes. The respective roles of industry and government are also explored, recognizing that it is through their collective actions that effective food safety systems are developed and verified. Understanding these systems and concepts can help countries determine whether imported foods were produced with an equivalent level of protection. *Microorganisms in Foods 7* is intended for anyone using microbiological testing or setting microbiological criteria, whether for governmental food inspection and control, or industrial applications. It is also intended for those identifying the most effective use of microbiological testing in the food supply chain. For students in food science and technology, this book provides a wealth of information on food safety management principles used by government and industry, with many references for further study. The information was prepared by the International Commission on Microbiological Specifications for Foods (ICMSF). The ICMSF was formed in response to the need for internationally acceptable and authoritative decisions on microbiological limits for foods in international commerce. The current membership consists of fifteen food microbiologists from twelve countries, drawn from government, universities, and food processing and related industries. --This text refers to the Digital edition.

The ICMSF functions as a small "working group", not a forum for the reading of papers or political debate. We are an action-oriented group with a history of evaluating issues and making timely contributions on newly emerging food safety concerns. The Commission has performed in-depth studies on all essential aspects relating to microbiological specifications for foods such as: methods of analysis, sampling plans, and microbiological limits. In recent years, the Commission has worked to improve the microbiological safety of food through its books and other scientific publications, by participating in symposia and workshops, recommending sampling plans and microbiological criteria, and defining and promoting the use of GHP, HACCP and other systems of managing food safety. Members, as well as consultants, are selected based on their technical expertise, not as national delegates. All work is voluntary and without honoraria. --This text refers to the Digital edition.

I have used this so many times and actually got other people to buy it. It is very useful for Food Safety Management!

Very useful bookI will use it for my dissertation.
