Doug Eaton is the Distinguished Professor and Chairman of Physiology at Emory University. The

goal of his research is to examine the cellular signaling mechanisms which control all aspects of cellular function including cell growth, division, and responses to external stimuli. To examine these signaling mechanisms, he uses contemporary methods of cellular and molecular biology including patch voltage clamp methods and expression of cloned signaling molecules in *Xenopus* oocytes and other expression systems.

It got me through my exam!

A great resource for learning renal physiology. It helped me get through that section of physiology in PA school. Breaks things down in easy to understand sections with some basic review questions at the end.

USEFUL at work

I was looking for something more user friendly that I could use as an introduction, but it's much better as a review. Lots of reading which slowed me down. I only read a few chapters. I might pick it up again later but it's a little time consuming. I think there are a lot better resources out there like YouTube channels, Khan Academy, First Aid that together get the job done. I don't really think this book has much of a place on a modern medical student's shelf unless you like the slow antiquated format.

Great Book. Very comprehensive and thorough in covering aspects of renal physiology.

I appreciate the level of detail in a small package. Of course, I have to remember that this does not include pathology - just healthy operation. Still - well organized and easy to carry around instead of a larger book including more systems.

Decent writing without errors. Complete and accurate information, but overall a mediocre text as the authors consistently opt for two pages of difficult to read text when a carefully drawn meaningful schematic or other image and a small paragraph could convey the same information. Good for some physiologists but kind of a low yield waste of time for a medical student.

Great read. Short yet comprehensive.
